

Univariate :

1) Central Dedency

```
[11]: for colName in quan:
        descriptive[colName]["Mean"] = dataset[colName].mean()
        descriptive[colName]["Median"] = dataset[colName].median()
        descriptive[colName]["Mode"] = dataset[colName].mode()[0]
descriptive
```

|               | sl_no | ssc_p     | hsc_p     | degree_p  | etest_p   | mba_p     | salary        |
|---------------|-------|-----------|-----------|-----------|-----------|-----------|---------------|
| <b>Mean</b>   | 108.0 | 67.303395 | 66.333163 | 66.370186 | 72.100558 | 62.278186 | 288658.405405 |
| <b>Median</b> | 108.0 | 67.0      | 65.0      | 66.0      | 71.0      | 62.0      | 265000.0      |
| <b>Mode</b>   | 1     | 62.0      | 63.0      | 65.0      | 60.0      | 56.7      | 300000.0      |

In this image, Means almost close for Sl\_no, ssc\_p, degress\_p, etest\_p, mba\_p. but salary only having high level difference in mean and median. So, salary having outlier.

## 2) Percentile

```
17]: for colName in quan:
        descriptive[colName]["Mean"] = dataset[colName].mean()
        descriptive[colName]["Median"] = dataset[colName].median()
        descriptive[colName]["Mode"] = dataset[colName].mode()[0]
        descriptive[colName]["Q1:25%"] = dataset.describe()[colName]["25%"]
        descriptive[colName]["Q2:50%"] = dataset.describe()[colName]["50%"]
        descriptive[colName]["Q3:75%"] = dataset.describe()[colName]["75%"]
        descriptive[colName]["99%"] = np.percentile(dataset[colName],99)
        descriptive[colName]["Max"] = dataset.describe()[colName]["max"]
descriptive
```

```
17]:
```

|        | sl_no  | ssc_p     | hsc_p     | degree_p  | etest_p   | mba_p     | salary        |
|--------|--------|-----------|-----------|-----------|-----------|-----------|---------------|
| Mean   | 108.0  | 67.303395 | 66.333163 | 66.370186 | 72.100558 | 62.278186 | 288655.405405 |
| Median | 108.0  | 67.0      | 65.0      | 66.0      | 71.0      | 62.0      | 265000.0      |
| Mode   | 1      | 62.0      | 63.0      | 65.0      | 60.0      | 56.7      | 300000.0      |
| Q1:25% | 54.5   | 60.6      | 60.9      | 61.0      | 60.0      | 57.945    | 240000.0      |
| Q2:50% | 108.0  | 67.0      | 65.0      | 66.0      | 71.0      | 62.0      | 265000.0      |
| Q3:75% | 161.5  | 75.7      | 73.0      | 72.0      | 83.5      | 66.255    | 300000.0      |
| 99%    | 212.86 | 87.0      | 91.86     | 83.86     | 97.0      | 76.1142   | NaN           |
| Max    | 215.0  | 89.4      | 97.7      | 91.0      | 98.0      | 77.89     | 940000.0      |

```
12]: import numpy as np
```

In this image, Q1, Q2, Q3, 99%, max are different type of location for splitting data percentage.

For Examples, Consider as ssc\_p

Q1 = 25% , Q2= 50% = 60.6 -67.0 = overall 7% percentage difference from Q1 to Q2

Q2 = 50% , Q3= 75% = 67.0 -75.7 = overall 8% percentage difference from Q2 to Q3

Q3 = 50% , 99% = 75.7-87.0 = overall 12% percentage difference from Q3 to 99%

99% , Q4= 100% or MAX = 87.0 -89.4 = overall 2% percentage difference from 99% to 100%

Based on above data each percentage wise categorize the data percentage.
